

Lesson 3 Homework - Finding Angles in Right Triangles

1. Fill in the sides in the following ratios

$\cos A = \frac{\text{adjacent}}{\text{hypotenuse}}$ $\tan A = \frac{\text{opposite}}{\text{adjacent}}$ $\sin A = \frac{\text{opposite}}{\text{hypotenuse}}$

Find the measure of angle M in each of the given right triangles, to the nearest degree. Show all work.

2. $m\angle M = 45^\circ$

3. $m\angle M = 60^\circ$

4. $m\angle M = 40^\circ$

5. $m\angle M = 30^\circ$

6. Use your calculator to determine the measure of $\angle A$ to the nearest tenth.

a. $\sin A = 0.1908$ 11.0

b. $\cos A = 0.3356$ 70.4

c. $\cos A = 0.9397$ 20.0

d. $\tan A = 1.4142$ 54.7

e. $\sin A = .5800$ 35.5

f. $\tan A = 1.7321$ 60.0

$\cos Z = 44.4$

$m\angle Z = 44.4^\circ$

$\cos^{-1}\left(\frac{5}{7}\right) = 44.4^\circ$

Jan 29-10:41 AM

SOH CAH TOA

$\sin A = \frac{\text{opp}}{\text{hyp}}$ $\cos A = \frac{\text{adj}}{\text{hyp}}$ $\tan A = \frac{\text{opp}}{\text{adj}}$

missing side

$\sin 30 = \frac{x}{2}$

$\sin X = \frac{1}{2}$

missing angle

\sin^{-1} \cos^{-1} \tan^{-1}

Jan 29-10:43 AM

7. If the hypotenuse and a leg of a triangle measure 13 and 8, respectively, what is the value of the angle between them to the nearest tenth of a degree?

The angle is 52.0°

$\cos X = \frac{8}{13}$

8. In a triangle, the lengths of the two legs are 4 and 5. What is the measure of the angle between the hypotenuse and the longer leg, to the nearest degree?

The angle is 39°

9. In the diagram below, $\angle B$ and $\angle D$ are right angles. Find $m\angle ACD$, to the nearest hundredth of a degree.

$a^2 + b^2 = c^2$ $m\angle ACD = 50.28^\circ$

$6^2 + 2.5^2 = AC^2$

$6.5 = AC$

$\sin X = \frac{5}{6.5}$

Lesson 4: Finding Sides of a Right Triangle (BE SURE THAT YOUR CALCULATOR IS IN DEGREES)

Warm-up: Solve for x in each equation.

$5 = \frac{x}{27}$ $6 = \frac{30}{x}$ $\frac{12}{8} = \frac{3}{x+2}$

Jan 22-11:35 AM

Example 1:
Use a calculator to calculate the ratio of the sides of a triangle with the given angles. Please round to the nearest thousandth.

$\sin 18^\circ = .309$ $\sin 1^\circ = 0.017$ $\cos 35^\circ = .819$
 $\cos 40^\circ = .766$ $\tan 80^\circ = 5.671$ $\tan 21^\circ = 0.384$

Dec 31-4:02 PM

Example 2:
Calculate the unknown side in each of the following, to the nearest tenth:

a) $\sin 20^\circ = \frac{a}{15}$ b) $\cos 37^\circ = \frac{30}{d}$

$\sin 20^\circ = \frac{a}{15}$ $\cos 37^\circ = \frac{30}{d}$
 $15 \cdot \sin 20^\circ = a$ $d \cdot \cos 37^\circ = 30$
 $5.1 = a$ $d = 37.6$

Dec 31-4:03 PM

Example 3:
Label your sides as opposite, adjacent, and hypotenuse.

Which trigonometric ratio could be used to find side x?

Side y?

$\sin 25^\circ = \frac{7}{x}$
 $x \cdot \sin 25^\circ = 7$
 $x = 16.6$

$\tan 25^\circ = \frac{7}{y}$
 $y \cdot \tan 25^\circ = 7$
 $y = 15.0$

Dec 31-4:03 PM

Example 3:
Label your sides as opposite, adjacent, and hypotenuse.

Which trigonometric ratio could be used to find side x?

Side y?

$\sin 25^\circ = \frac{7}{x}$
 $x = 16.6$

$\tan 25^\circ = \frac{7}{y}$
 $y = 15.0$

Dec 31-4:03 PM

Steps to finding Sides:

1. Label your sides as opposite, adjacent, and hypotenuse (according to the given angle).
2. Choose the correct ratio (using the given side and the desired side): \sin , \cos , or \tan
3. Set up ratio and solve

Dec 31-4:03 PM

Example 4: Calculate the length of side a to the nearest integer.

Dec 31-4:03 PM

Example 4: Calculate the length of side a to the nearest integer.

$(\cos 60) = \frac{a}{12}$
 $a = 12(\cos 60)$
 $a = 6$

Dec 31-4:03 PM

Example 5: Calculate the length of side c to the nearest hundredth.

Dec 31-4:03 PM

Example 5: Calculate the length of side c to the nearest hundredth.

$(\cos 45) = \frac{8}{c}$
 $c(\cos 45) = 8$
 $c = \frac{8}{\cos 45}$
 $c = 11.31$

$8 / \cos 45$
 11.3137085

Dec 31-4:03 PM

Example 6: Find the length of each of the missing sides in the given triangles to the nearest whole number.

~~S2H~~ ~~CAH~~ ~~TOA~~

$\tan A = \frac{\text{opp}}{\text{adj}}$
 $\tan 52 = \frac{12}{d}$
 $d \cdot \tan 52 = 12$
 $d = \frac{12}{\tan 52}$
 $d = 9$

Dec 31-4:03 PM

Example 6: Find the length of each of the missing sides in the given triangles to the nearest whole number.

$(\tan 52) = \frac{12}{d}$
 $12 = d(\tan 52)$
 $d = \frac{12}{(\tan 52)}$

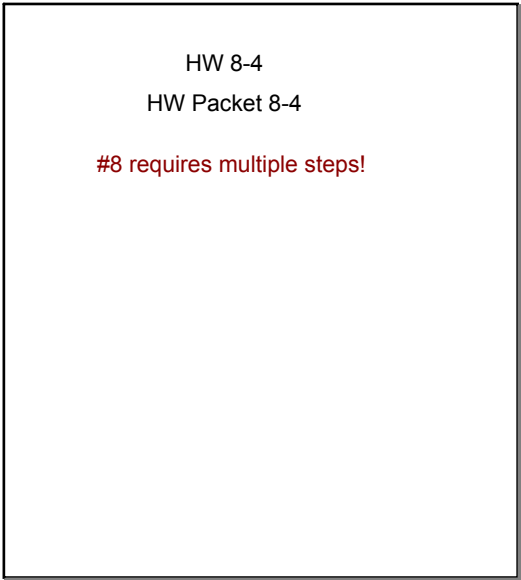

Dec 31-4:03 PM

Example 7: In right triangle ABC, hypotenuse $AB = 15$ and angle $A = 35^\circ$. Find the length of BC to the nearest tenth.
