### **Emath Worksheet**

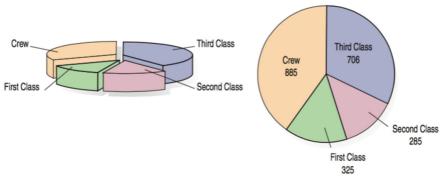

- 1. 2
- 2. 4
- 3. 1
- 4. Female likes SS = 37% Male likes math = 38% Not correct. Male slightly more likely to like math.
- 5. SS is Female = 58% Female likes SS = 37% More likely that a person who likes SS is Female.

6.		Car	Train	Walk	Total
	NY	5%	25%	10%	40%
	LA	18%	12%	5%	35%
	Chic	8%	14%	3%	25%
	Total	31%	51%	18%	100%

	7.	3	١
	8.	4	
1	9.	1	

# **Review:** What Can Go Wrong?

Don't violate the area principle.

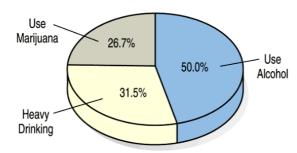

The graph on the left shows data on a slant, making it much more difficult to compare fractions of the whole made up of each class.

## What Can Go Wrong? (cont.)

Keep it honest—make sure your display shows what it says it shows.

This plot of the percentage of high-school students who engage in specified dangerous behaviors has a problem. Can you see it?

**PEARSON** 

## What Can Go Wrong? (cont.)

- Don't confuse similar-sounding percentages pay particular attention to the wording of the context. For example:
  senior males/total seniors
  - What percentage of seniors are males?
  - What percentage of males are seniors?

senior males/total males

 Don't forget to look at the variables separately too—examine the marginal distributions, since it is important to know how many cases are in each category.

PEARSON

## What Can Go Wrong? (cont.)

- Be sure to use enough individuals-when using percentages, take care that they are based on a large enough number of individuals.
- Don't overstate your case—don't claim something you can't. It is rare for two variables to be entirely independent.

**PEARSON** 

#### What have we learned?

- We can summarize categorical data by counting the number of cases in each category (expressing these as counts or percents).
- We can display the distribution in a bar chart or pie chart.
- And, we can examine two-way tables called contingency tables, examining marginal and/or conditional distributions of the variables.

## Pro Tip

Labels and scales on all graphs are essential.

#### Review (pg. 30-33 in text):

- Don't confuse similar sounding percentages (read carefully!) pay particular attention to the wording of the context:
  - a. What percentage of seniors are males? #male seniors/#seniors
  - b. What percentage of males are seniors? #male seniors/#males
  - c. What percentage of students are males? #males/#total students
- . Be able to define and use the following vocabulary words (see page 33):
  - a. Frequency Table vs. Relative Frequency Table
  - b. Distribution
  - c. Bar and Pie charts
  - d. Contingency Table
  - e. Marginal Distribution vs. Conditional Distribution
  - f. Independence vs. Association
